

# Faculty of Technology and Engineering

## U & P U. Patel Department of Computer Engineering

Date : 10 / 12 / 2025

### Practical List

Academic Year	:	2025-2026	Semester	:	6
Course code	:	CE365	Course name	:	Compiler Construction

Sr. No.	Aim	Hr	CO																
1.	<p><b>Practical Definition</b>            String Validation Against Regular Expression</p> <p><b>Objective</b>            To implement a program that validates a user-input string against the regular expression <math>a^*bb</math>. The program should determine whether the input string is valid or invalid based on the defined pattern.</p> <p><b>Language Constraint</b>            The program must be implemented in C language.</p> <p><b>Input Requirements</b></p> <ul style="list-style-type: none"> <li>Accept a character string from the user.</li> <li>Ensure the input is terminated with a newline character.</li> </ul> <p><b>Expected output</b></p> <ul style="list-style-type: none"> <li>If the input string matches the pattern <math>a^*bb</math>, the program should output: "Valid String".</li> <li>If the input string does not match the pattern, the program should output: "Invalid String".</li> </ul> <p><b>Sample input output</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center; padding: 2px;">Input</th><th style="text-align: center; padding: 2px;">Output</th></tr> </thead> <tbody> <tr> <td style="text-align: center; padding: 2px;">aaabb</td><td style="text-align: center; padding: 2px;">Valid string</td></tr> <tr> <td style="text-align: center; padding: 2px;">abab</td><td style="text-align: center; padding: 2px;">Invalid string</td></tr> </tbody> </table> <p><b>Testcases</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="text-align: center; width: 15%;">^</td><td style="text-align: center; width: 15%;">bbbb</td><td style="text-align: center; width: 15%;">aaa</td><td style="text-align: center; width: 15%;">baaabbb</td><td style="text-align: center; width: 15%;">aaabbbb</td></tr> <tr> <td style="text-align: center;">baaabbb</td><td style="text-align: center;">aaaab</td><td style="text-align: center;">abbabb</td><td style="text-align: center;">abb</td><td style="text-align: center;">aaaaabb</td></tr> </table>	Input	Output	aaabb	Valid string	abab	Invalid string	^	bbbb	aaa	baaabbb	aaabbbb	baaabbb	aaaab	abbabb	abb	aaaaabb	2	1
Input	Output																		
aaabb	Valid string																		
abab	Invalid string																		
^	bbbb	aaa	baaabbb	aaabbbb															
baaabbb	aaaab	abbabb	abb	aaaaabb															

2.	<p><b>Practical Definition</b> String Validation Using Finite Automata</p> <p><b>Objective</b> To implement a program that validates a given string against rules defined in terms of finite automata.</p> <p><b>Language Constraint</b> The program can be implemented in any programming language</p> <p><b>Input requirement</b></p> <ul style="list-style-type: none"> <li>• Accept rules in the form of finite automata (e.g., states, transitions, start state, accept states) as input.</li> <li>• Accept a string to be validated against the provided finite automata rules.</li> </ul> <p><b>Expected output</b></p> <ul style="list-style-type: none"> <li>• If the string adheres to the rules of the finite automata, the program should output: "Valid String".</li> <li>• If the string does not adhere to the rules, the program should output: "Invalid String".</li> </ul> <p><b>Sample input output</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center; padding: 5px;">Input</th><th style="text-align: center; padding: 5px;">Output</th></tr> </thead> <tbody> <tr> <td style="padding: 5px;">           Number of input symbols : 2            Input symbols : a b            Enter number of states : 4            Initial state : 1            Number of accepting states : 1            Accepting states : 2            Transition table :            1 to a -&gt; 2            1 to b -&gt; 3            2 to a -&gt; 1            2 to b -&gt; 4            3 to a -&gt; 4            3 to b -&gt; 1            4 to a -&gt; 3            4 to b -&gt; 2             Input string : abbabab         </td><td style="padding: 5px; vertical-align: top;">           Valid string         </td></tr> </tbody> </table> <p><b>Testcases</b></p> <ul style="list-style-type: none"> <li>• String over 0 and 1 where every 0 immediately followed by 11</li> <li>• string over a b c, starts and end with same letter.</li> <li>• String over lower-case alphabet and digits, starts with alphabet only.</li> </ul>	Input	Output	Number of input symbols : 2 Input symbols : a b Enter number of states : 4 Initial state : 1 Number of accepting states : 1 Accepting states : 2 Transition table : 1 to a -> 2 1 to b -> 3 2 to a -> 1 2 to b -> 4 3 to a -> 4 3 to b -> 1 4 to a -> 3 4 to b -> 2  Input string : abbabab	Valid string	2	1
Input	Output						
Number of input symbols : 2 Input symbols : a b Enter number of states : 4 Initial state : 1 Number of accepting states : 1 Accepting states : 2 Transition table : 1 to a -> 2 1 to b -> 3 2 to a -> 1 2 to b -> 4 3 to a -> 4 3 to b -> 1 4 to a -> 3 4 to b -> 2  Input string : abbabab	Valid string						

<p><b>3. Practical Definition</b> Implementation of a Lexical Analyzer for C Language Compiler</p> <p><b>Objective</b> To design and implement a lexical analyser, the first phase of a compiler, for the C programming language. The lexical analyser should perform the following tasks: (1) tokenizing the input string (2) removing comments (3) removing white spaces (4) entering identifiers into the symbol table (5) generating lexical errors.</p> <p><b>Language Constraint</b> The program can be implemented in any programming language</p> <p><b>Input requirement</b></p> <ul style="list-style-type: none"> <li>• Accept a C source code file.</li> <li>• The input can contain keywords, identifiers, constants, strings, punctuation, operators, comments, and white spaces.</li> </ul> <p><b>Expected output</b></p> <ul style="list-style-type: none"> <li>• Tokenized output categorizing tokens into five types: keyword, identifier, constant, punctuation, and operator.</li> <li>• Symbol table with all identified identifiers stored.</li> <li>• Detected lexical errors</li> </ul> <p><b>Sample input output</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center; padding: 5px;">Input</th><th style="text-align: center; padding: 5px;">Output</th></tr> </thead> <tbody> <tr> <td style="padding: 10px;"> <pre>int main() { int a = 5 , 7H; // assign value char b = 'x'; /* return value */ return a + b; }</pre> </td><td style="padding: 10px;"> <p>TOKENS</p> <p>Keyword: int Identifier: main Punctuation: ( Punctuation: ) Punctuation: { Keyword: int Identifier: a Operator: = Constant: 5 Punctuation : , Punctuation: ; Keyword: char Identifier: b Operator: = Constant: 'x' Punctuation: ; Keyword: return Identifier: a Operator: + Identifier: b Punctuation: ; Punctuation: }</p> <p>LEXICAL ERRORS Line 2 : 7H invalid lexeme</p> <p>SYMBOL TABLE ENTRIES 1) a 2) b</p> </td></tr> </tbody> </table> <p><b>Testcases</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; padding: 5px;"> <pre>/* salary calculation*/ void main() {</pre> </td><td style="width: 50%; padding: 5px;"> <pre>// user defined data type struct student {</pre> </td></tr> </table>	Input	Output	<pre>int main() { int a = 5 , 7H; // assign value char b = 'x'; /* return value */ return a + b; }</pre>	<p>TOKENS</p> <p>Keyword: int Identifier: main Punctuation: ( Punctuation: ) Punctuation: { Keyword: int Identifier: a Operator: = Constant: 5 Punctuation : , Punctuation: ; Keyword: char Identifier: b Operator: = Constant: 'x' Punctuation: ; Keyword: return Identifier: a Operator: + Identifier: b Punctuation: ; Punctuation: }</p> <p>LEXICAL ERRORS Line 2 : 7H invalid lexeme</p> <p>SYMBOL TABLE ENTRIES 1) a 2) b</p>	<pre>/* salary calculation*/ void main() {</pre>	<pre>// user defined data type struct student {</pre>	<p>4</p> <p>1</p>
Input	Output						
<pre>int main() { int a = 5 , 7H; // assign value char b = 'x'; /* return value */ return a + b; }</pre>	<p>TOKENS</p> <p>Keyword: int Identifier: main Punctuation: ( Punctuation: ) Punctuation: { Keyword: int Identifier: a Operator: = Constant: 5 Punctuation : , Punctuation: ; Keyword: char Identifier: b Operator: = Constant: 'x' Punctuation: ; Keyword: return Identifier: a Operator: + Identifier: b Punctuation: ; Punctuation: }</p> <p>LEXICAL ERRORS Line 2 : 7H invalid lexeme</p> <p>SYMBOL TABLE ENTRIES 1) a 2) b</p>						
<pre>/* salary calculation*/ void main() {</pre>	<pre>// user defined data type struct student {</pre>						

	<pre> long int bs , da , hra , gs; //take basic salary as input scanf("%ld",&amp;bs); //calculate allowances da=bs*.40; hra=bs*.20; gs=bs+da+hra; // display salary slip printf("\n\nbs : %ld",bs); printf("\nda : %ld",da); printf("\nhra : %ld",hra); printf("\ngs : %ld",gs); } </pre>	<pre> int id; float cgpa; } void main( ) { student s; s.id = 10; s.cgpa = 8.7; } </pre>		
	<pre> //function prototype void add ( int , int ); void main( ) { int a , b; a = 10; b = 20; // function call add ( a , b ); } void add ( int x , int y ) { return x + y; } </pre>			

4.	<p><b>Practical Definition</b> String validation using Lax tool</p> <p><b>Objective - 1</b> Write a program to identify and extract all numbers from input string and display them one by one in new line.</p> <p><b>Language Constraint</b> Lex (Lexical analyser generator)</p> <p><b>Input requirement</b></p> <ul style="list-style-type: none"> <li>• Accept a character string, mix of text and numbers, from the user.</li> <li>• Ensure the input is terminated with a newline character.</li> </ul> <p><b>Expected output</b> The program should print out each number found in the input, each on a new line.</p> <p><b>Sample input output</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center; padding: 5px;">Input</th><th style="text-align: center; padding: 5px;">Output</th></tr> </thead> <tbody> <tr> <td style="padding: 5px;">a1b22c3</td><td style="padding: 5px; vertical-align: top;">           1            22            3         </td></tr> </tbody> </table> <p><b>Testcases</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 5px;">power operation -&gt; 12 ** 3 = 1728</td></tr> <tr> <td style="padding: 5px;">You multiply 804569 with 1 then will be :</td></tr> </table> <p><b>Objective - 2</b> Write a program to replace the word "charusat" with "university" in the input text.</p> <p><b>Language Constraint</b> Lex (Lexical analyser generator)</p> <p><b>Input requirement</b></p> <ul style="list-style-type: none"> <li>• Accept a character string from the user where the word "charusat" may appear multiple times.</li> <li>• Ensure the input is terminated with a newline character.</li> </ul> <p><b>Expected output</b> The program should print the input text with all occurrences of "charusat" replaced by "university".</p> <p><b>Sample input output</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center; padding: 5px;">Input</th><th style="text-align: center; padding: 5px;">Output</th></tr> </thead> <tbody> <tr> <td style="padding: 5px;">This is charusat.</td><td style="padding: 5px;">This is university.</td></tr> </tbody> </table> <p><b>Testcases</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 5px;">Charusat is in Anand district.</td><td style="padding: 5px;">I am doing my BTech from CHARSAT.</td></tr> <tr> <td style="padding: 5px;">Charusat , What is charusat?</td><td style="padding: 5px;">Every where it is charusat , charusat and only charusat.</td></tr> </table>	Input	Output	a1b22c3	1 22 3	power operation -> 12 ** 3 = 1728	You multiply 804569 with 1 then will be :	Input	Output	This is charusat.	This is university.	Charusat is in Anand district.	I am doing my BTech from CHARSAT.	Charusat , What is charusat?	Every where it is charusat , charusat and only charusat.	4	1
Input	Output																
a1b22c3	1 22 3																
power operation -> 12 ** 3 = 1728																	
You multiply 804569 with 1 then will be :																	
Input	Output																
This is charusat.	This is university.																
Charusat is in Anand district.	I am doing my BTech from CHARSAT.																
Charusat , What is charusat?	Every where it is charusat , charusat and only charusat.																

**Objective – 3**

Write a program to count number of characters, word and lines from the input file.

**Language Constraint**

Lex (Lexical analyser generator)

**Input requirement**

Read contain from a text file containing multiple word and lines.

**Expected output**

The program should print total number of characters (including spaces), words (separated by white spaces), lines (end with new line symbol).

**Sample input output**

Input	Output
The 45 is odd number.	Characters : 22 Words : 5 Line : 1

**Testcases**

I want to calculate a number. The number of characters, words and lines.

All know that \n is ending character of line.

45 + 89 =40

**Objective – 4**

Write a program which validate the password as per given rules.

- length can be 9 to 15 characters
- includes lower case letter, upper case letter, digit, symbols (\*, ; # \$ @)
- minimum count for each category must be one

**Language Constraint**

Lex (Lexical analyser generator)

**Input requirement**

- Accept a character string from the user which is mix of letters, numbers and symbols.
- Ensure the input is terminated with a newline character.

**Expected output**

- If the password meets the given rules, the program should print "Valid password".
- If the password does not meet the rules, the program should print "Invalid password".

**Sample input output**

Input	Output
a@1T	Invalid password

**Testcase**

	aB1@	aaBB11,#cdefg2345	CHARUSAT		
	Charusat	CHARusat123	Cspit-2024		
	Charusat@2024	Charu\$at@20#24	charu*sAT;22		

<p><b>Practical Definition</b> Implementation of a Lexical Analyzer for C Language Compiler</p> <p><b>Objective</b> To design and implement a lexical analyser to perform 1<sup>st</sup>, 2<sup>nd</sup>, 3<sup>rd</sup>, and 5<sup>th</sup> task as per the list given in practical 2.</p> <p><b>Language Constraint</b> Lex (Lexical analyser generator)</p> <p><b>Input requirement</b></p> <ul style="list-style-type: none"> <li>• Accept a C source code file.</li> <li>• The input can contain keywords, identifiers, constants, strings, punctuation, operators, comments, and white spaces.</li> </ul> <p><b>Expected output</b></p> <ul style="list-style-type: none"> <li>• Tokenized output categorizing tokens into six types: keyword, identifier, constant, string, punctuation, and operator.</li> <li>• Detection and reporting of lexical errors</li> </ul> <p><b>Sample input output</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center; padding: 5px;">Input</th><th colspan="2" style="text-align: center; padding: 5px;">Output</th></tr> </thead> <tbody> <tr> <td style="padding: 10px; vertical-align: top;"> <pre>int main() {     int a = 5 , 7H;     // assign value     char b = 'x';     /* return     value */     return a + b; }</pre> </td><td style="padding: 10px; vertical-align: top;"> <p>TOKENS          Keyword: int          Identifier: main          Punctuation: (          Punctuation: )          Punctuation: {          Keyword: int          Identifier: a          Operator: =          Constant: 5          Punctuation : ,          Punctuation: ;          Keyword: char          Identifier: b          Operator: =          Constant: 'x'          Punctuation: ;          Keyword: return          Identifier: a          Operator: +          Identifier: b          Punctuation: ;          Punctuation: }</p> </td><td style="padding: 10px; vertical-align: top;"> <p>LEXICAL ERRORS          Line 2 : 7H invalid lexeme</p> <p>SYMBOL TABLE ENTRIES          1) a          2) b</p> </td></tr> </tbody> </table> <p><b>Testcases</b></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tbody> <tr> <td style="padding: 10px; vertical-align: top;"> <pre>/* salary calculation*/ void main() {     long int bs , da , hra , gs;     //take basic salary as input     scanf("%ld",&amp;bs);     //calculate allowances</pre> </td><td style="padding: 10px; vertical-align: top;"> <pre>// user defined data type struct student {     int id;     float cgpa; } void main()</pre> </td></tr> </tbody> </table>	Input	Output		<pre>int main() {     int a = 5 , 7H;     // assign value     char b = 'x';     /* return     value */     return a + b; }</pre>	<p>TOKENS          Keyword: int          Identifier: main          Punctuation: (          Punctuation: )          Punctuation: {          Keyword: int          Identifier: a          Operator: =          Constant: 5          Punctuation : ,          Punctuation: ;          Keyword: char          Identifier: b          Operator: =          Constant: 'x'          Punctuation: ;          Keyword: return          Identifier: a          Operator: +          Identifier: b          Punctuation: ;          Punctuation: }</p>	<p>LEXICAL ERRORS          Line 2 : 7H invalid lexeme</p> <p>SYMBOL TABLE ENTRIES          1) a          2) b</p>	<pre>/* salary calculation*/ void main() {     long int bs , da , hra , gs;     //take basic salary as input     scanf("%ld",&amp;bs);     //calculate allowances</pre>	<pre>// user defined data type struct student {     int id;     float cgpa; } void main()</pre>	<p>2</p>	<p>1</p>
